

Customer Journey Map

Date	July 9, 2026
Team ID	SWTID-2026-1262
Project Name	OptiCrop: Smart Agricultural Production Optimization Engine
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Discovery & Onboarding	Stage 2 Diagnostic Execution	Stage 3 Strategic Evaluation & Planning
Actions <i>What does the customer do?</i>	The farmer or researcher accesses the platform locally and sets up their environmental profile.	The user inputs specific soil metrics (N, P, K, pH) and ambient weather variables (temperature, humidity, rainfall).	The user analyzes the dynamic recommendations and incorporates the insights into their farming plan or research policy.
Touchpoint <i>What part of the service do they interact with?</i>	Responsive Bootstrap Web Portal Landing Interface (index.html).	Form fields, data entry matrices, and tabbed workflow panels on the interactive UI.	Dynamic Intelligence Result Output screen (result.html) with customized scenario response blocks.
Customer Thought <i>What is the customer thinking?</i>	"Is this application simple enough for me to configure without an IT background?"	"Will the model accurately interpret my unique combination of soil acidity and micro-climate parameters?"	"How can I adjust my fertilizer distribution and seed purchase strategy based on these predictive metrics?"

Customer Feeling <i>What is the customer feeling?</i>	Curious but cautious about whether a data-driven model will fit traditional farming workflows.	Engaged and hopeful as they provide real, actionable soil chemistry measurements into the engine.	Empowered and confident with clear, automated alignment indicators replacing guesswork.
Process Ownership <i>Who is in the lead on this?</i>	Full-Stack Development Lead — Managing frontend accessibility and server routing.	Machine Learning & Backend Engineer — Handling raw feature processing, code array formatting, and model pipeline lookups.	Agricultural Data Analyst / Solutions Architect — Driving contextual insights mapping and system roadmaps.
Opportunities <i>How can we improve this stage?</i>	Introduce simple onboarding tooltip overlays or data-range validation guides on the layout fields.	Implement safe client-side field validation to intercept type mistypes before the server script processes the array.	Add a feature to download or print a PDF summary of the diagnostic profile card for regional documentation sharing.
